ABSTRACT
ICT gives visually impaired people two fundamental freedom. Independence and choice in library services, before electronic information and online catalogue became available visually impaired people required assistance with reading and had limited choice reading material. The article aims to give an overview of the changes in librarianship, which have taken place in the recent decades do to the dynamic development and widen horizons of information and communication technologies (ICT), and to show how these changes have influenced service aspect of the libraries. It also puts forth the competencies and skills required by the library professionals to manage the changes
